1. Features
- Thermal Sensitive Layer Over a 0.35 µm CMOS Array
- Image Zone: 0.4 ×11.6 mm
- Image Array: 8 × 232 = 1856 Pixels
- Pixel Pitch: 50 × 50 µm = 500 dpi Resolution
- On-chip 8-bit Analog to Digital Converter
- Serial Peripheral Interface (SPI) - 2 Modes:
  - Fast Mode at 16 Mbps Max for Imaging
  - Slow Mode at 200 kbps Max for Navigation and Control
- Die Size: 1.5 × 15 mm
- Operating Voltage: 2.3 to 3.6V
- I/O Voltage: 1.65 to 3.6V
- Operating Temperature Range: -40°C to 85°C
- Finger Sweeping Speed from 2 to 20 cm/Second
- Low Power: 4.5 mA (Image Acquisition), 1.5 mA (Navigation), <10 µA (Sleep Mode)
- Hard Protective Coating (>4 Million Sweeps)
- High Protection from Electrostatic Discharge
- Small Form Factor Packaging
- Comply with the European Directive for Restriction of Hazardous Substances (RoHS Directive)

2. Description
Atmel's AT77C105A fingerprint sensor is dedicated to PDA, cellular and smartphone applications. Based on FingerChip thermal technology, the AT77C105A is a linear sensor that captures fingerprint images by sweeping the finger over the sensing area. This product embeds true hardware-based 8-way navigation and click functions as well, as enabling elimination of mechanical joystick devices.

3. Applications
- Scrolling, Menu and Item Selection for PDAs, Cellular or Smartphone Applications
- Cellular and Smartphones-based Security (Device Protection, Network and ISP Access, E-commerce)
- Personal Digital Agenda (PDA) Access
- User Authentication for Private and Confidential Data Access
- Portable Fingerprint Acquisition

</tr>
</tbody>
</table>

Note: The die attach is connected to pin 6 and must be grounded. The FPL pin must also be grounded.
Figure 3-1. Typical Application

The pull-up must be implemented for the master controller. The noise should be lower than 30 mV peak-to-peak on VDDA.

Table 3-2. Pin Description

| NC   | 1  |
| NC   | 2  |
| NC   | 3  |
| NC   | 4  |
| GNDD | 5  |
| GNDA | 6  |
| VDDD | 7  |
| VDDA | 8  |
| SCK  | 9  |
| TESTA| 10 |
| MOSI | 11 |
| VDD_IO| 12 |
| MISO | 13 |
| SCANEN| 14 |
| SSS  | 15 |
| IRQ  | 16 |
| FSS  | 17 |
| RST  | 18 |
| FPL  | 19 |

The TESTA pin is only used for testing and debugging. The SCANEN pin is not used in the final application and must be connected to ground.

Warning: SSS and FSS must never be low at the same time. When both SSS and FSS equal 0, the chip switches to scan test mode. With the SPI protocol, this configuration is not possible as only one slave at a time can be selected. However, this configuration works when debugging the system.

5. Power Consumption and DC Characteristics

The following characteristics are applicable to the operating temperature \(-40^\circ C \leq T \leq +85^\circ C\). Typical conditions are: power supply = 3.3V; \(T_{\text{amb}} = 25^\circ C\); \(F_{\text{SCK}} = 12\) MHz (1600 slices per second); duty cycle = 50% \(C_{\text{LOAD}}\) 120 pF on digital outputs unless otherwise specified.

5.3 Input/Output Voltage Level Compatibility

The I/O voltage level compatibility is set by the power voltage driven on the VDD_IO pad. For 1.8V level compatibility, connect VDD_IO to a 1.8V power supply.
6. Switching Performances

The following characteristics are applicable to the operating temperature \(-40°C \leq T \leq +85°C\).

Typical conditions are: nominal value; \(T_{amb} = 25°C\); \(F_{SCK} = 12\) MHz; duty cycle = 50%; \(C_{LOAD} = 120\) pF in digital output unless specified otherwise.

7. Timing Diagrams: Slow and Fast SPI Interface

Figure 7-1. Read Timing Fast SPI Slave Mode

Figure 7-2. Read/Write Timing Slow SPI Slave Mode

Figure 7-3. Read Status Register to Release IRQ
8. Functional Description

The AT77C105A is a fingerprint sensor based on FingerChip technology. It is controlled by an SPI serial interface through which output data is also transferred (a slow SPI for the pointing function and a fast one for acquisition). Six modes are implemented:

- **Sleep Mode:** A very low consumption mode controlled by the reset pin RST. In this mode, the internal clocks are disabled and the registers are initialized.

- **Stand-by Mode:** Also a low consumption mode that waits for an action from the host. The slow serial port interface (SSPI) and control blocks are activated. In this mode the oscillator can remain active.

- **Click Mode:** Waits for a finger on the sensor. The SSPI and control blocks are activated. The local oscillator, the click array and the click block are all activated.

- **Navigation Mode:** Calculates the finger’s x and y movements across the sensor. The SSPI and control blocks are still activated. The local oscillator, the navigation array and the navigation block are all activated.

- **Acquisition Mode:** Slices are sent to the host for finger reconstruction and identification. The SSPI and control blocks are still activated. The fast serial port interface block (FSPI) and the acquisition array are activated, as well as the local oscillator when watchdog is required.

- **Test:** This mode is reserved for factory testing.

In the final application, three main modes are used:

- **Stand-by:** Low consumption mode
- **Pointing:** Equivalent to click and navigation modes
- **Acquisition:** Fingerprint image capture

Note: The term “host” describes the processor (controller, DSP...) linked to the sensor. It is the master. In the description of n-bit registers (see “Function Registers” on page 11), the term “b0” describes the Least Significant Bit (LSB). The term “b(n-1)” describes the Most Significant Bit (MSB). Binary data is written as 0b_ and hexadecimal data as 0x_.
9. Sensor and Block Diagram

Figure 9-1. Functional Block Diagram

The circuit is divided into the following main sections:

- An array or frame of 8 × 232 pixels + 1 dummy column
- An analog to digital converter
- An on-chip oscillator
- Control and status registers
- Navigation and click units
- Slow and fast serial interfaces

</tbody>
</table>

- CLICK: Click detection
  0: default
  1: click detected

- MOV: Movement detection
  0: default
  1: X or Y movement detected

- TRANSIT: Not used, for testing only

- SLICE: Not used, for testing only

- READERR: Read error detection
  0: default, no error
  1: read error detected

Note: To clear the interrupts, the status register is initialized after each reading from the host.

10.2 Modectrl Register

Register Name: Modectrl (7 bits)
Access Type: Read/Write
Function: Mode control
• **MODE**: Select operating mode
  0000: standby
  0001: test (reserved for factory use)
  0010: click
  0100: navigation
  1000: acquisition

Certain changes can be made. For example, MODE can be set to 0b0110 to activate click and navigation.

• **ANALOGRST**: Reset local oscillator
  0: oscillator in active mode
  1: oscillator in power-down mode

Notes:
1. Click or navigation modes cannot be used when the local oscillator is switched off.
2. To return to standby mode and stop the oscillator (to save on power consumption), two Modectrl register accesses are necessary: the first one to select standby mode and the second to switch off the oscillator.
3. The read-only registers cannot be read when the oscillator is turned off.
4. To shift between navigation and acquisition modes, you must be in standby mode (Modectrl = 0b00001).

If modes such as “acquisition and click” or “acquisition and navigation” are programmed together, they will be ignored by the system.

With x = 0 or 1.

### 10.3 Enctrl Register

**Register Name**: Enctrl (7 bits)

**Access Type**: Read/Write

**Function**: Interrupts control
• **CLICKEN**: Click interrupts enable
  0: default
  1: click IRQ enabled
  IRQ is generated when a click is detected.

• **MOVEN**: Movement interrupts enable
  0: default
  1: movement IRQ enabled
  IRQ is generated when an X or Y movement is detected.

• **TRANSITEN**: Not used, for testing only
• **SLICEN**: Not used, for testing only
• **READERREN**: Read error interrupts enable
  0: default
  1: read error IRQ enabled
  IRQ is generated when a read error is detected.

  Note: The interrupt is cleared after the status register is read.

## 10.4 Heatctrl Register

**Register Name**: Heatctrl (7 bits)

**Access Type**: Read/Write

**Function**: Heating control

<table>
<thead>
<tr>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>HEAT</td>
<td>WDOGEN</td>
<td>HEATV (MSB)</td>
<td>HEATV(LSB)</td>
<td>–</td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

| – | – | – |
| 0 | 0 | 0 |

• **HEAT**: Sensor heating
  0: default, no heating
  1: heating
  The default value is recommended to optimize power consumption.

• **WDOGEN**: Watchdog enable
  0: default
  1: watchdog enabled
  Watchdog automatically stops heating of the sensor after a time-out.

• **HEATV (2 bits)**: Heating power value
  00: 50 mW
  01: 100 mW
  10: reserved
  11: reserved
  $V_{DD}$ is between 2.5 and 3.6V.
Notes: 1. Heating can only be used in the acquisition mode (it is not allowed in navigation or click modes).
2. The oscillator has to be activated when the watchdog is required and must not be stopped while the watchdog remains active.

10.5 Navctrl Register

Register Name: Navctrl (7 bits)
Access Type: Read/Write
Function: Navigation control

<table>
<thead>
<tr>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- **NAVFREQ**: Navigation frequency
  - 00: 5.8 kHz
  - 01: 2.9 kHz (default value)
  - 10: 1.9 kHz
  - 11: 1.5 kHz

A faster frequency enables faster finger movement detection. A lower frequency enhances sensitivity. Refer to Notes 1 and 2 on page 15.

- **NAVV**: Navigation pixels threshold
  - 00: lower threshold
  - 01:
  - 10:
  - 11: higher threshold

Sets the minimum analog value detected as a high level ('1'). Refer to Note 1 on page 15.

- **CLICKV**: Click pixels threshold
  - 00: lower threshold
  - 01:
  - 10:
  - 11: higher threshold

Sets the minimum analog value detected as a high level ('1') and the maximum analog value detected as a low level ('0'). See Note 3 on page 15.

Notes: 1. Navfreq and Navv registers should not be changed once the navigation mode is selected. Finger sensitivity refers to the minimum level of information required from a finger. The sensitivity is linked to the integration time; a longer integration time enables better sensitivity but does not tolerate fast movement.
2. The navigation frequency is the frequency needed for the reading of one new navigation frame.
3. The Clickv register should not be changed once the click mode is selected.
10.6 Clickctrl Register

Register Name: Clickctrl (7 bits)
Access Type: Read/Write
Function: Click control

<table>
<thead>
<tr>
<th>CLICKFREQ (MSB)</th>
<th>CLICKFREQ (LSB)</th>
<th>CLICKDET (MSB)</th>
<th>CLICKDET (LSB)</th>
<th>CLICKCPT (MSB)</th>
<th>CLICKCPT (LSB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

- **CLICKFREQ**: Click pixels reading frequency
  - 00: 180 Hz
  - 01: 90 Hz (default value)
  - 10: 60 Hz
  - 11: 45 Hz

  Faster frequency enables faster finger click detection. Lower frequency enables higher sensitivity.

- **CLICKDET**: Threshold for selecting the black/white color of a slice
  - 00: more than 7 black/white pixels and less than 5 white/black pixels
  - 01: more than 8 black/white pixels and less than 4 white/black pixels
  - 10: more than 9 black/white pixels and less than 3 white/black pixels
  - 11: more than 10 black/white pixels and less than 2 white/black pixels

- **CLICKCPT**: Click detection counter (maximum number of slices read between two transitions)
  - 000: 5
  - 001: 7
  - 010: 10
  - 011: 12
  - 100: 16
  - 101: 20
  - 110: 25
  - 111: 31

  Two transitions are interpreted as a click if the number of slices between them is less than CLICKCPT. This is used to differentiate a touch-down/touch-up from a real click. A click is equivalent to two close touch-down/touch-up transitions.

  This register adjusts the “time out” for considering the two transitions as a click.

Note: Clickfreq and Clickcpt registers should not be changed once the click mode is selected.
10.7 Movectrl Register

**Register Name:** Movctrl (7 bits)

**Access Type:** Read/Write

**Function:** In stream mode, during navigation calculation, the AT77C105A must interrupt the host when a maximum absolute X or Y movement is detected (second and third navigation registers). The MOVCTRL register enables you to control this value. This value can be set as the minimum finger movement value at which the pointing device makes a displacement.

<table>
<thead>
<tr>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>(MSB)</td>
<td>–</td>
<td>–</td>
<td>–</td>
<td>–</td>
<td>–</td>
<td>(LSB)</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- MOVCTRL: Generates an interrupt when the second or third navigation register (X or Y absolute movement) is greater than the value programmed in the Movectrl register
  0b0000000
  0b0000001
  0b0000010
  ...
  0b1111111

For example, when MOVCTRL = 0b0001001, an interruption to the host is generated when the absolute X movement register (second navigation register) or absolute Y movement register (third navigation register) is greater than 0b00010010.

Note: The Movectrl register should not be changed once the navigation mode is selected.

10.8 Navigation Register

**Register Name:** Navigation (3 x 8 bits)

**Access Type:** Read Only (these three registers cannot be read individually. The reading command of the first navigation register [address 0b1000] returns the value of the three registers).

**Function:** The format of the navigation registers is similar to the PS/2 protocol. Three registers are used to codemovements and clicks. The navigation registers are initialized after each reading. The registers only represent actions (movement, click, transition...) that have occurred since the last data packet sent to the host.
## 10.8.1 General Register

<table>
<thead>
<tr>
<th>b7</th>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>

<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- **YOVR**: Y overflow
  - 0: default
  - 1: Y movement overflow
  
  High (‘1’) when the Y movement counter is overflowed.

- **XOVR**: X overflow
  - 0: default
  - 1: X movement overflow
  
  High (‘1’) when the X movement counter is overflowed.

- **YSIGN**: Y sign bit
  - 0: default, positive Y movement
  - 1: negative Y movement
  
  High (‘1’) when the Y movement is negative. Low when the Y movement is positive.

- **XSIGN**: X sign bit
  - 0: default, positive X movement
  - 1: negative X movement
  
  High (‘1’) when the X movement is negative. Low when the X movement is positive.

- **TRANS**: Not used, for test purposes only.

- **CLICK**: Click
  - 0: default
  - 1: click detected
  
  This function is not in the PS/2 protocol.

- **FINGER**: Not used, for test purposes only.

Note: In the PS/2 protocol, bits b2 and b1 are used to code the middle and right buttons respectively, and b3 is set to high.
### 10.8.2 Absolute X Movement Register (0 to 255 Pixels)

<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Note: When a click is detected, the information is placed in the b7 bit of the status register and in the b1 bit of the general navigation register. The reading of the status register initializes the b7 bit but does not initialize the b1 bit of the general navigation register. The host must carefully correlate the two bits.

### 11. SPI Interface General Description

Two communication busses are implemented in the device:

- The control interface, a slow bus that controls and reads the internal registers (status, navigation, control...).
- The pixels’ acquisition interface, a fast bus that enables full pixel acquisition by the host.

A synchronous Serial Port Interface (SPI) has been adopted for the two communication busses. The SPI protocol is a slave/master fullduplex synchronous serial communication. This protocol uses three communication signals:

- SCK (Serial Clock): the communication clock
- MOSI (Master Out Slave In): the data line from the master to the slave
- MISO (Master In Slave Out): the data line from the slave to the master

The slaves are selected by an input pin SS/ (Slave Select). A master can communicate with several slaves.

The word length of the transferred data is fixed to 8 bits. The Most Significant Bit (MSB) is sent first. For each 8-bit transfer, 8 bits are sent from the master to the slave and 8 bits transferred from the slave to the master. Transfers are still synchronized with the communication clock (SCK). Only the host can initialize transfers. To send data, the slave must wait for an access from the master. When there is no transfer, a clock is not generated.
When a master is connected with several slaves, the signals SCK, MISO and MOSI are interconnected. Each slave SS is driven separately. Only one slave can be selected, the others have their MISO tri-stated and ignore MOSI data.

The SS/ signal falls a half-period before the first clock edge, and rises a half-period after the last clock edge.

11.1 Clock Phase and Polarity

During phase zero of the operation, the output data changes on the clock’s falling edge and the input data is shifted in on the clock’s rising edge. In phase one of the operation, the output data changes on the clock’s rising edge and is shifted in on the clock’s falling edge.

Polarity configures the clock’s idle level, which is high ("1") during polarity one of the operation and low ("0") during polarity zero of the operation.

11.2 AT77C105A and the SPI

The AT77C105A is always the slave and the host always the master. The host drives the SCK clock. Both the AT77C105A and the host transmit data with the MISO signal. The word length of the transferred data is fixed to 8 bits. The Most Significant Bit (MSB) is sent first.

The AT77C105A supports only one phase and polarity configuration:

- The clock's idle level set to high (polarity 1)
- The output data changed on the clock's falling edge, and input data shifted in on the clock's rising edge (phase 0).
11.2.1 Recommendations

The SSS or FSS falling edge should be half a clock cycle before the first SCK falling edge and the SSS or FSS rising edge should be half a clock cycle after the last SCK rising edge.

11.3 SPI Behavior with Hazardous Access

The control register block uses an internal finite state machine that can only be initialized by the RST pin (asynchronous reset). When SPI access does not use 8 clock pulses, the internal finite state machine is desynchronized. The only way to resynchronize it is by resetting the sensor with the RST pin. No requester modification is recorded when a write access is made on a read-only register. Reliable initialization of read-only registers is not guaranteed when the slow SPI’s maximum clock frequency is not respected.

12. Control Interface (Slow SPI)

This interface controls the sensor’s internal registers. The protocol enables reading and writing of these registers.

The master (host) initiates transfers to the slave (sensor). The sensor can only use its interrupt pin to communicate with the host. When the host is interrupted, it must read the status register before continuing operation.

The word length of the transferred data is fixed to 8 bits. The Most Significant Bit (MSB) is sent first.

12.1 Communication Protocol

Accesses to the host are structured in packets of words. The first word is the command and the other words are the data.

The b7 bit is used to differentiate the command and data. When the word is a command, b7 is high (‘1’) and when the word is a piece of data, b7 is low (‘0’).

The following protocol is used:
12.1.0.1 Command Format

The host indicates to the sensor if it wants to read or write into a register and indicates the register’s address.

<table>
<thead>
<tr>
<th>b7</th>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

12.1.0.2 Data Format (Writing into Register)

If writing into a register, the host transmits the data.

<table>
<thead>
<tr>
<th>b7</th>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

12.1.0.3 Data Format (Reading of Register)

If reading a register, the host transmits one or several packets of data and data is shifted in from the sensor. The host transmits dummy words with the data format (b7 is low ["0"]). If reading the navigation or click pixel registers, the host transmits three packets of data to read the three registers.

<table>
<thead>
<tr>
<th>b7</th>
<th>b6</th>
<th>b5</th>
<th>b4</th>
<th>b3</th>
<th>b2</th>
<th>b1</th>
<th>b0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>x</td>
<td>x</td>
<td>x</td>
<td>x</td>
<td>x</td>
<td>x</td>
<td>x</td>
</tr>
</tbody>
</table>

Note: The host cannot communicate with the sensor without receiving data from it. Useless data is ignored by the host.

12.2 Communication Speed

To reduce consumption, the control interface’s communication speed is set to the lowest possible speed and depends on the host’s configuration.

To communicate with “fast” controllers, the sensor’s communication speed can be set to 200 kbits/s.

12.2.1 Example for the MODECTRL Register

Figure 10 represents a typical writing sequence into an internal register (MODECTRL register in this example).

See Appendix B for flowchart.
Figure 12-1. Writing into an Internal Register

Note: The break on SCK on the SPI chronogram has been added for better comprehension only. In a real application, SCK can be continuous.

Figure 12-2. Reading Sequence of a Register (Except for Navigation Registers)

12.3 Example of Navigation Registers

Figure 12 represents a typical reading sequence of the three navigation registers.

Refer to "Appendix C" on page 34 for flowchart
13. Image Capture (Fast SPI)

This serial interface enables full-speed acquisition of the sensor’s pixels by the host. This interface only supports the serial clock (SCK) and one data line: MISO (Master In/Slave Out).

13.1 Communication Protocol

When the sensor is in acquisition mode, the host can receive pixels through the fast SPI (FSS/ = 0). The host must transmit the communication clock (SCK) to receive the pixels. This clock must have a regular frequency to obtain constant fingerprint slices (See “Registration Integration Time” on page 26.).

With the sensor configured to acquisition mode, the controller can proceed to fast accesses.

During an 8-bit access, the sensor transmits two pixels (each pixel is coded on 4 bits).
13.2 Communication Speed

The acquisition speed of the pixels is linked to the clock’s communication speed. The faster the communication clock, the faster the authorized maximum finger sweeping speed. The sensor supports fast communications up to 16 Mbps.

13.3 Reading of Frame

A frame consists of 232 true columns and 1 dummy column of 8 pixels of 4 bits each. A frame starts with a dummy column.

The first dummy column, at the beginning of the pixel array, is added to the sensor to act as a specific easy-to-detect pattern, and represents the start of the frame tag.

The pixel array is always read in the following order: the first byte, following the 4 bytes of the dummy column, which contains the value of the pixels physically located on the upper left corner of the array, when looking at the die with bond pads to the right. Then another 4 bytes are read that contain the value of the pixels located in the same column from top to bottom. The next column on the right is output, and so on, until the last line on the right, close to the bond pads, is output.

Even values are first sent during the data serialization for SPI transfer. Therefore, the synchronization sequence on the chip’s MISO output is F0F00200.
Notes: 1. For the first array or frame reading, 40 dummy clock cycles must be sent before the first data arrives. This is necessary for the initialization of the chip pipeline. Consequently, the first synchronization sequences appear after 40 clock cycles. For the following array readings, data arrives at each clock cycle. One should implement a synchronization routine in the protocol to look for the F0F00200 pattern.
2. The Most Significant Bit (MSB) is sent first.

13.4 Reading of Entire Image

The FingerChip delivers fingerprint slices or frames with a height of 0.4 mm and a width of 11.6 mm (this equals 8 × 232 pixels). Pixels are sampled/read sequentially and are synchronous with SCK. Raw slices are captured by the acquisition system and overlapped with the corresponding X or Y finger displacement computed by Atmel reconstruction software. This reconstruction software supports a sweeping speed from 2 to 20 cm/s.

The table below shows finger speeds according to the different clock frequencies. The reconstruction results are obtained after acquisition of all slices.

Table 13-1. Finger Speeds Versus Clock Frequencies

13.5 Registration Integration Time

The pixel’s integration time (the time needed for one frame reading) must be as regular as possible to obtain consistent fingerprint slices. This time is directly dependant on the SCK, SPI clock and frequency. Therefore, the SPI cycle of 4 × 8 × 233 clock pulses should be as regular as possible.
Figure 13-5. Regular Integration Time

Note: The 500 µs duration corresponds to the host's computation time (slice reconstruction, finger detection...) and in the illustration is given as an example only. Once the host detects a finger, this value remains constant, thus guaranteeing a regular integration time.

14. Navigation (Slow SPI)

The sensor's navigation function includes the processing elements necessary for providing the displacement of the finger touching the sensor in an up or down and right or left direction. It is aimed at a screen menu navigation or simple pointing application. In addition, a click processing function is embedded to detect a quick touch of the finger on the sensor. It is aimed at screen text, box or object selection. A double-click function could also be implemented in the software.

This interface has been designed to resemble the PS/2 mouse protocol.

An interrupt signal IRQ indicates to the host that an action has been detected. The host must read the status register to obtain details on the action. The IRQ signal enables implementation of an efficient power consumption protocol.

Note:
- Click and navigation modes can be used together.
- Two configurations are implemented for the click and navigation modes:
  - Stream mode, where the sensor sends an interrupt to the host when a movement or a change in the button's state is detected.
  - Remote mode, where the sensor does not interrupt the host but waits for its registers to be read.

In these two modes, the registers are initialized after each reading from the host.

See “Appendix D” on page 35. for an example of an interrupt generated by a movement detection.

14.1 Navigation

See “Navigation Register” on page 17.

The typical navigation slice frequency has been fixed to 2.9 kHz. A programmable divider is implemented in the control registers (NAVFREQ) to reduce this frequency. Finger displacement is provided as a number of pixels in X and Y directions. Negative movements are possible. The
register is cleared after the navigation registers are read. These registers are incremented or decremented between two accesses.

</tbody>
</table>

14.2 Click

See “Clickctrl Register” on page 16.

The sensor generates a click detection. The host must read the b7 bit of the status register or the b1 bit of the general navigation register.

The click function is composed of an array of a few pixels and a processing unit. The typical click slice frequency is 90 Hz. A programmable divider is implemented to modify this frequency in the control registers (CLICKFREQ).

14.3 Double-click

This function is performed by the controller, allowing better flexibility. It detects a succession of two clicks.

15. Temperature Stabilization Function and Watchdog

The sensor has an embedded temperature stabilization unit that identifies a difference in temperature between the finger and the sensor. When this difference is increased, the images are more contrasted. This function is optional and its use depends on the quality of the image processing software, therefore its management should be decided together with the image processing software.

In order to limit excessive current consumption by the use of the temperature stabilization function, a watchdog has been implanted in the sensor. The local oscillator stops the heating of the module after a defined time. The oscillator should not be stopped as long as watchdog is active, otherwise the clock stops automatically.

When heating of the sensor is requested “1” is written in bit 6 of the HEATCTRL register) and the watchdog is enabled “1” is written in bit 5 of the HEATCTRL register), the sensor is heated during ‘n’ seconds.

Due to the oscillator frequency dispersion, the value of n is:

2 seconds (minimum) < n = 4 seconds (typical) < 7 seconds (maximum).

The accuracy of n is not important since the heat register can be enabled successively.

The level of power consumption is programmable. Two pre-programmed values are set to 50 or 100 mW.
The dissipated die power is quasi constant over a significant supply voltage range as shown below (mode 50 mW selected):

Figure 15-1.

Note: This function is useless for navigation and click modes.

16. Power Management

   Reset high

16.2 Standby Mode
   (<10 µA Providing SPI Bus not Accessed)
   Power consumption can be reduced in several ways:
   - By switching off the FingerChip sensor.
   - By programming a standby mode by writing 00001xx in the MODCTRL register (STANDBY mode set and oscillator stopped.) Bit b6 (HEAT) of the HEATCTRL register must be turned to ‘0’ when programming standby mode.

16.3 Acquisition Mode Current Consumption

16.3.1 Static Current Consumption
   When the SPI bus is not used, only the analog part of the circuit consumes power at around 4 mA.

16.3.2 Dynamic Current Consumption
   When the clock is running, the digital sections also consume current. With a 30 pF load at 16 MHz, the power consumption is approximately 4.5 mA on the VDD pins.
16.4 Navigation and Click Modes Current Consumption

16.4.1 Static Current Consumption
The SPI bus’ consumption is very low in click and navigation modes, the majority of the consumption being generated by the analog part of the circuit. Therefore, the static and dynamic consumption is almost the same.

16.4.2 Dynamic Current Consumption
With a 30 pF load at maximum clock frequency, the current consumption in click mode is almost 300 µA on pins VDD. With a 30 pF load at maximum clock frequency, the current consumption in navigation mode is approximately 1.5 mA.

Note: We advise use of the interrupt capabilities (IRQ signal or Interrupts register) so as to limit the host's overall current consumption. The host can, from time to time, check the IRQ or Interrupt register. A strategy for very low power consumption is to use the click mode only as a wake-up. The click mode is only 300 µA, and once a click is detected the host can turn on the navigation mode as well.

17. Packaging Mechanical Data (values to be confirmed)

17.1 Package Information

17.1.1 Electrical Disturbances

Three areas of the FingerChip device must never be in contact with the casing, or any other component, so as to avoid electrical disturbances. These areas are shown in Figure 17-3:

Figure 17-3. Sensitive Areas

![Sensitive Areas Diagram]

Figure 17-4. Epoxy Overflow

Maximum epoxy overflow width: 0.35 mm on the die edge.

Maximum epoxy overflow thickness: 0.33 mm.

![Epoxy Overflow Diagram]

Note: Refer to Figure 17-1 on page 30.

19. Appendix A

19.1 Controller Initialization

```
1. Host Controller Initialization
   Controller Initialized?
      Yes
      SPI Initialization (Phase = 0, Polarity = 1)
      SPI Initialized?
         Yes
         RST = 1
         Sensor Initialization
         Pulse > 10 us?
            No
            Yes
            RST = 0
      No
   No
```

20. Appendix B

20.1 Example for the MODECTRL Register

- **Interrupts Masked**
  - \( SSS/ = 0 \)
  - MODECTRL Writing Requested
  - Sending of \( 0b10000100 \)
  - Transfer ended ?
    - No
    - Yes
  - MODECTRL Reading Requested
  - Sending \( 0b11000100 \)
  - Transfer ended ?
    - No
    - Yes
  - MODECTRL Writing Requested
  - Sending \( 0b10000100 \)
  - Transfer ended ?
    - No
    - Yes

- **SSS/ = 1**
  - Interrupts enabled
  - Sensor
  - Reception of the Command Reading of MODECTRL
  - Sending of MODECTRL
  - Reception of the Command Writing of MODECTRL
  - Sending of the New MODECTRL
  - Transfer ended ?
    - No
    - Yes
  - Reception of MODECTRL
  - Transfer ended ?
    - No
    - Yes
  - \( SSS/ = 1 \)
  - Interrupts enabled
21. Appendix C

21.1 Example of Navigation Registers

![Diagram of Navigation Registers]

- **Sensor**
  - Reception of the Command Reading of NAVIGATION
  - Sending of NAVIG1
  - Sending of NAVIG2
  - Sending of NAVIG3

- **Controller**
  - Interrupts Masked 
    - SSS/ = 0
  - NAVIGATION Reading Requested
    - Sending 0b11000000
  - Transfer Ended?
    - Yes
      - Sending of Dummy Data 0b00000000
      - Reception of NAVIG1
      - Sending of NAVIG1
      - Sending of Dummy Data 0b00000000
      - Reception of NAVIG2
