**The Q3007 Biometric Transponder
– James Bond sends his best.**

SimonsVoss presents the Q3007, the completely battery-operated mobile biometry application in a handy format. An additional fingerprint sensor has been added to the current transponder function. Only authorized persons can operate our high-security transponder, offering security at secret agent level ■

Top security with easiest operation.

Pressing the button activates the fingerprint sensor. If you then sweep an "authorized" finger over the sensor, the transponder triggers – but only then. Learning new fingers (enrollment) requires only a simple "touch-in" process in the Biometric Transponder. It is possible to differentiate up to six users. The Biometric Transponder's battery is replaceable ■

Biometry enormously economically.

Use of the Q3007 is enormously economical, because our biometric solution does not require costly installation at the door. A digital SimonsVoss locking cylinder is in the door. While a classic biometric application must be installed at each door, our solution allows any number of doors – even those added at a later time – to be secured with only one Biometric Transponder. This means drastic cost reductions. The Q3007 component is a revolutionary high-security addition to the SimonsVoss Digital Locking and Organization System 3060 ■
